CNW-2511 CLOUD NETWORKING

Azure Web Hosting Lifecycle: CLI-Driven Static Sites & Serverless Apps Through a Red Team Lens

Full deploy-modify-teardown of Azure Storage static websites and App Service apps via CLI, mapped to HUMINT/SE adversary tradecraft and OPSEC discipline

COURSE

CNW-2511 Cloud Networking

DATE

April 2025

ENVIRONMENT

Azure for Students subscription (Subscription ID 89c4a4cc-1045-40eb-bc62-77cf81e56e1b)

Azure Web Hosting Lifecycle: CLI-Driven Static Sites & Serverless Apps Through a Red Team Lens

For Milestone 3 of CNW-2511 (the "3.5 Activity - Content Delivery" lab), I executed the full lifecycle of Azure-hosted web infrastructure — deployment, in-place content modification, and complete teardown — entirely through command-line tooling on an Azure for Students subscription spanning West US and Central US. I stood up a resource group (CNW-WEB), a StorageV2 LRS storage account (crichardweb) with static website hosting, then deployed and pivoted a static index.html (purple to yellow theme), and provisioned a serverless tier with an F1 Free App Service Plan and the cnw1crichard App Service, overwriting hostingstart.html via the Kudu API to serve a controlled lab page. No attacks were conducted; instead I framed each phase against real-world Red Team tradecraft — HUMINT-informed resource naming, social engineering plausibility, and OPSEC reflexes like blob overwrites over new-object creation to minimize storage telemetry. The engagement closed with a surgical, CLI-only resource group deletion that wiped all artifacts, simulating adversary cover-tracks behavior.

► Objectives

- Deploy, configure, and operationalize Azure cloud web services simulating early-stage infrastructure establishment
- Execute the full lifecycle (build, modify, teardown) of static websites and serverless apps entirely via CLI to minimize portal telemetry
- Host static content from Azure Storage and validate external exposure via the storage account's primary blob endpoint
- Stand up a serverless App Service tier and replace its default content using the Kudu file-management API
- Map each technical phase to real-world Red Team tradecraft (HUMINT, social engineering, OPSEC) without conducting any actual attacks
- Achieve complete environmental cleanup, leaving no residual cloud artifacts post-operation

► Environment

Azure for Students subscription (Subscription ID 89c4a4cc-1045-40eb-bc62-77cf81e56e1b)

Regions: West US and Central US (resources provisioned in Central US)

Resource Group: CNW-WEB

WALKTHROUGH & EVIDENCE

For Milestone 3 of CNW-2511, I drove the full lifecycle of Azure-hosted web infrastructure — deploy, modify, teardown — entirely from the Azure CLI on an Azure for Students subscription, then mapped each phase to real-world Red Team tradecraft (Initial Access through Cover Tracks). The build spans a StorageV2 static website (crichardweb) and an F1 Free Tier App Service (cnw1crichard), with in-place blob overwrites and Kudu edits chosen deliberately to suppress portal and storage telemetry. No attacks were conducted; the engagement closes with a single-command resource group deletion that wipes every artifact.

STEP 01 — INITIAL ACCESS

Storage Account & Static Website Hosting

Created resource group CNW-WEB in Central US, deployed the crichardweb storage account (StorageV2, Locally Redundant Storage), and enabled static website hosting on the \$web container with index.html as the index document.

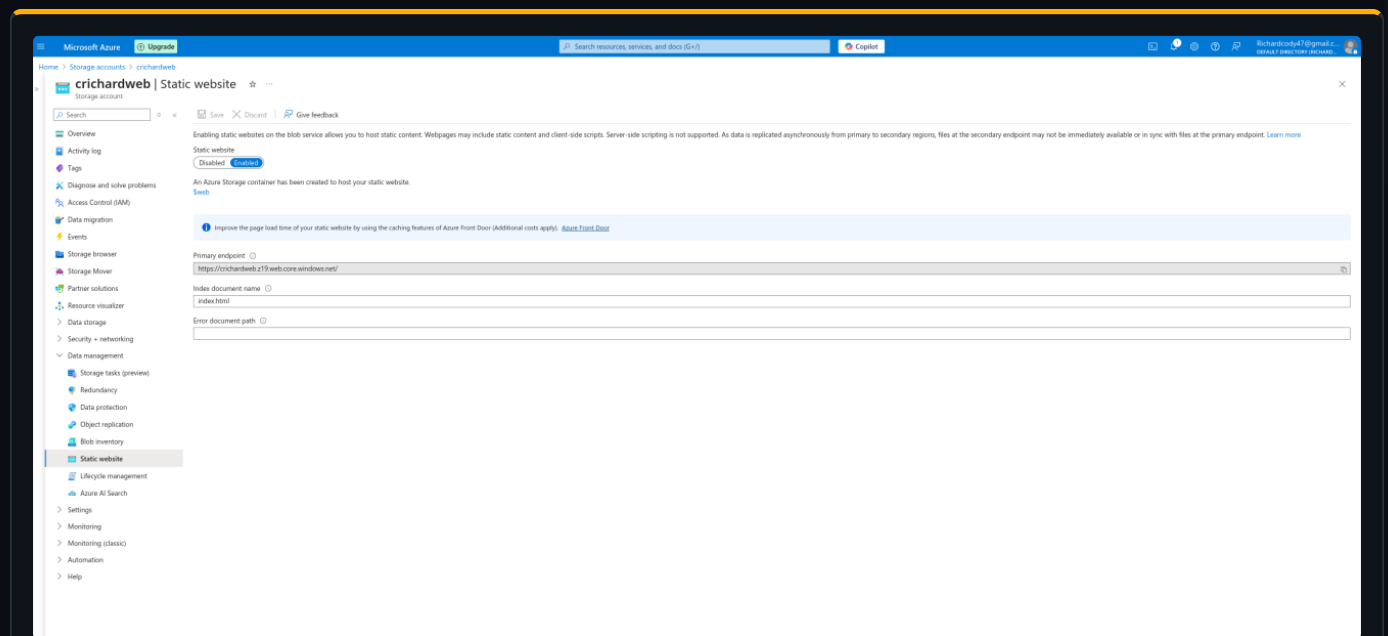

FIG 01 — crichardweb storage account — Static website blade set to Enabled, with the auto-created \$web container and primary endpoint `https://crichardweb.z19.web.core.windows.net/` serving `index.html` as the index document.

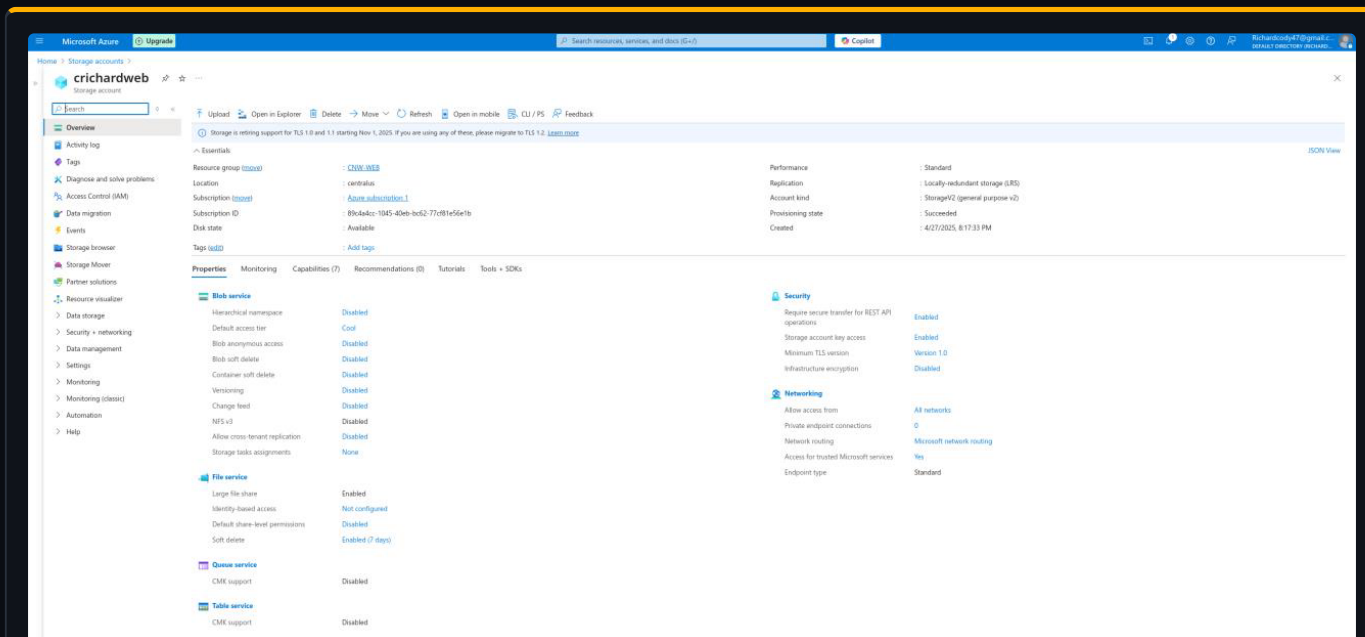

FIG 02 — crichardweb Overview — StorageV2 (general purpose v2) account, Locally Redundant Storage (LRS) replication, in resource group CNW-WEB, confirming the provisioned hosting tier.

STEP 02 — EXPOSURE

Static Content Deployment & In-Place Pivot

Uploaded the initial index.html to the \$web container and validated external reachability through the storage blob endpoint, then overwrote the blob in place to pivot the theme — minimizing storage-activity anomalies versus creating a new object.

FIG 03 — Initial deployment served from https://crichardweb.z19.web.core.windows.net/ — purple-themed 'WELCOME TO CNW PAGE 1' index.html with HOME/ABOUT/CONTACT nav, confirming external static hosting.

FIG 04 — Same endpoint after an in-place blob overwrite — yellow-themed Full Sail University page, demonstrating live content pivoting without uploading a new object.

STEP 03 — PERSISTENCE

Serverless App Service Provisioning

Created the crichardweb App Service Plan (F1 Free Tier, Windows) and the cnw1crichard App Service instance, then served a controlled lab page at its default domain.

FIG 05 — Live App Service at https://cnw1crichard.azurewebsites.net — red-themed 'Welcome to crichard's Azure WebApp!' page serving as a benign web-shell-equivalent for the lab.

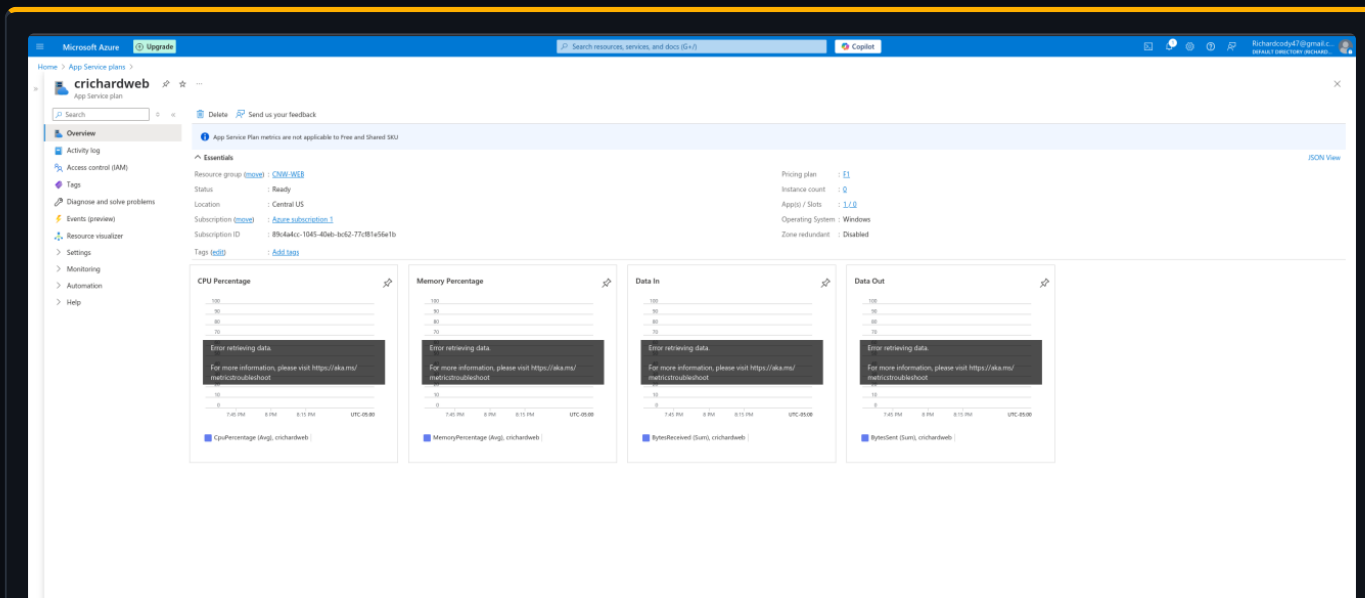

FIG 06 — crichardweb App Service Plan Overview — F1 pricing tier, Windows OS, Central US, status Ready, in resource group CNW-WEB (metrics N/A on Free/Shared SKU).

STEP 04 — PERSISTENCE / KUDU EDIT

Kudu API Content Overwrite

Used the Kudu (SCM) App Service Editor to directly overwrite hostingstart.html under wwwroot, replacing the default landing content rather than redeploying — an in-place edit consistent with low-footprint operator discipline.

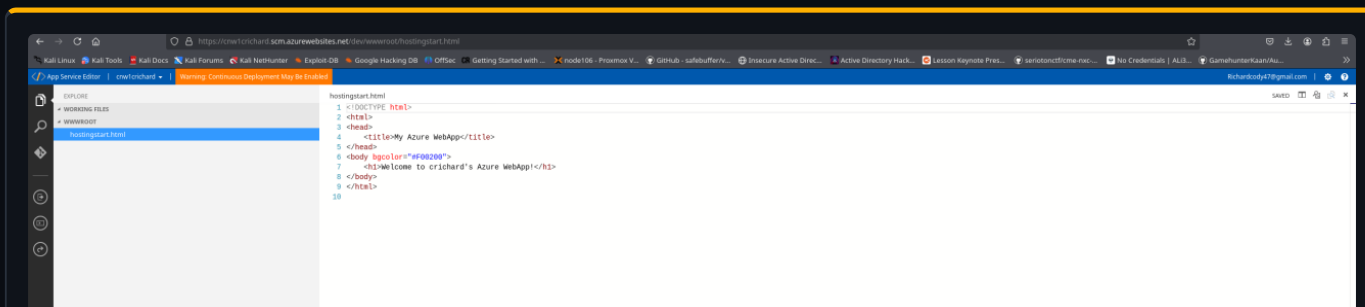

FIG 07 — Kudu App Service Editor at cnw1crichard.scm.azurewebsites.net — hostingstart.html source showing title 'My Azure WebApp', body bgcolor #F00200, and the h1 'Welcome to crichard's Azure WebApp!'.

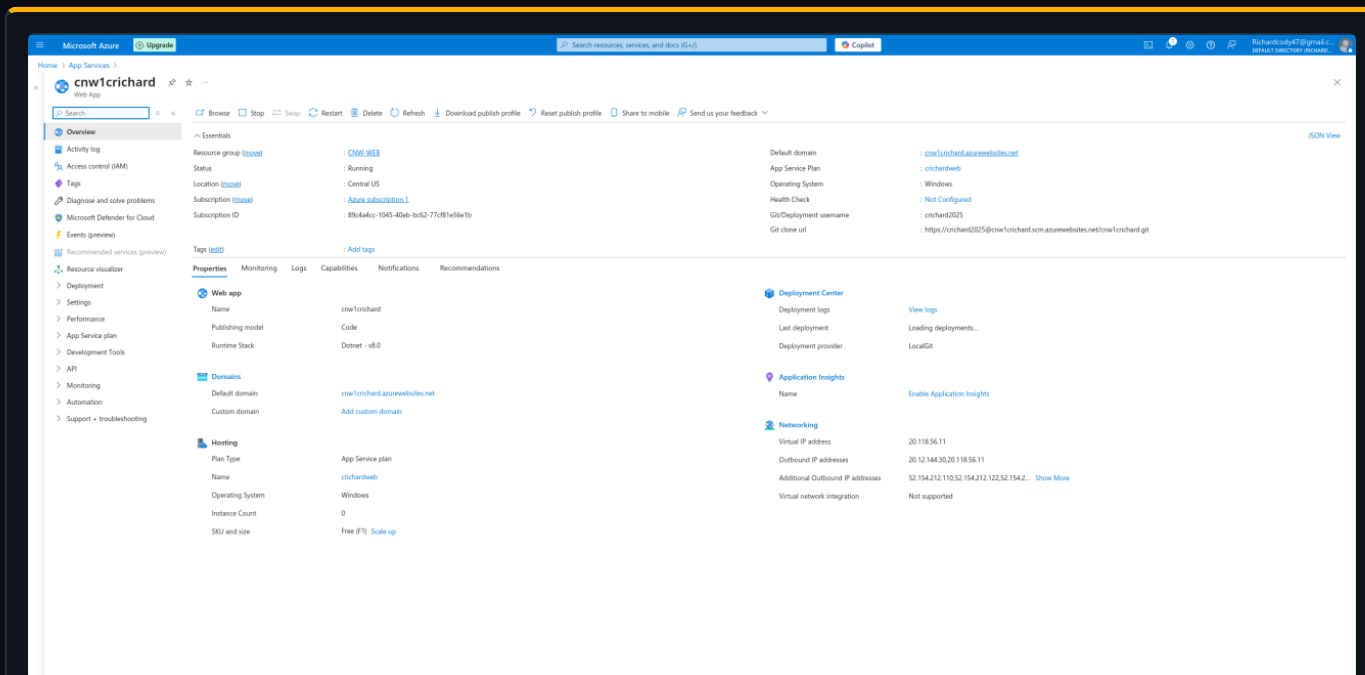

FIG 08 — cnw1crichard App Service Overview — Running, default domain cnw1crichard.azurewebsites.net, App Service Plan crichardweb, Dotnet v8.0 runtime, SKU Free (F1), LocalGit deployment provider.

STEP 05 — COVER TRACKS

Resource Group Teardown

Deleted the entire CNW-WEB resource group via the CLI, wiping the storage account, App Service, and App Service Plan in a single command and leaving no residual artifacts.

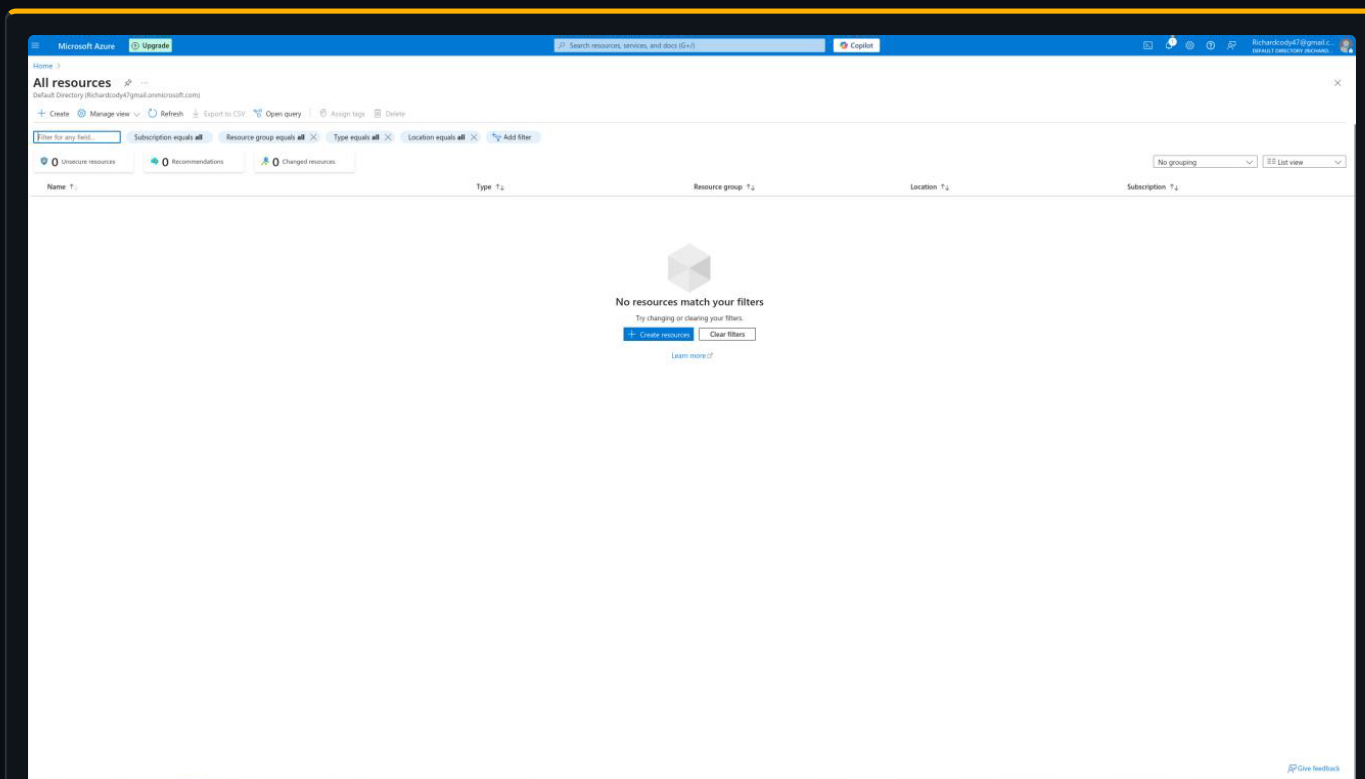

FIG 09 — Azure 'All resources' view post-teardown — 'No resources match your filters', confirming full environmental cleanup after the CLI resource group deletion.

STEP 06 – CLI TRADECRAFT

Behind the Scenes: CLI Operations

All deployment and validation ran from the Azure CLI to avoid portal-generated events — blob uploads to \$web, an external endpoint query for validation, and an --overwrite upload for the in-place content pivot.

```
➤ ssstrickys@kali ~/Desktop$ az storage blob upload \
--account-name crichardweb \
--container-name $web \
--name index.html \
--file index.html

There are no credentials provided in your command and environment, we will query for account key for your storage account.
It is recommended to provide --connection-string, --account-key or --sas-token in your command as credentials.

You also can add '--auth-mode login' in your command to use Azure Active Directory (Azure AD) for authorization if your login account is assigned required RBAC roles.
For more information about RBAC roles in storage, visit https://learn.microsoft.com/azure/storage/common/storage-auth-aad-rbac-cli.

In addition, setting the corresponding environment variables can avoid inputting credentials in your command. Please use --help to get more information about environment variable usage.
